

## Use of Modeling Tools for Documenting and Development of Advanced Communication Systems and Import of PNM Use Cases

Joe Hughes, EPRI  
Dr. Martin Burns, Hypertek

Smart Grid Advisory Meeting  
Oct 12, 2009  
New Mexico

1

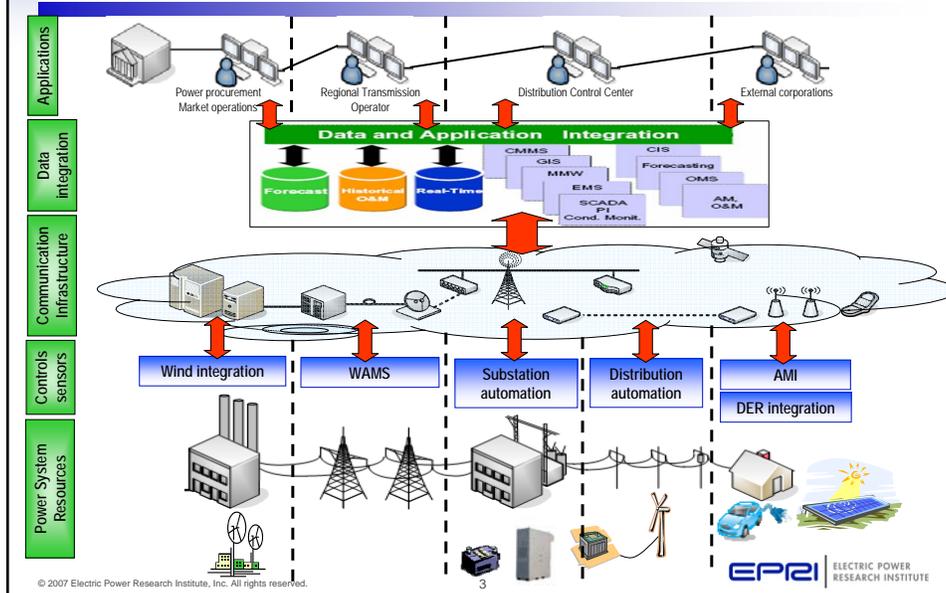

## Presentation Overview

- Background on Models and Tools For Advanced Systems
- The Import Process for PNM Use Cases
- Background on NIST Knowledge Base Development

2

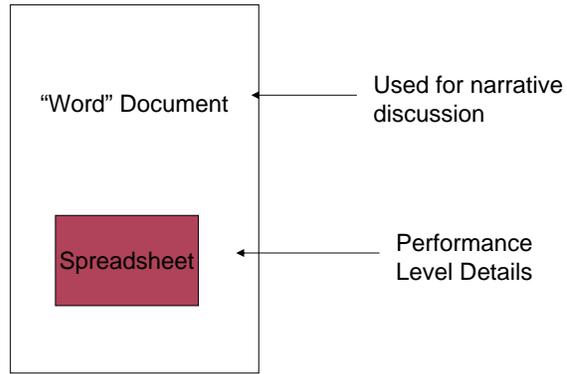

## Next Generation of Systems Will Be More Complex and More Challenging to Specify, Document and Manage

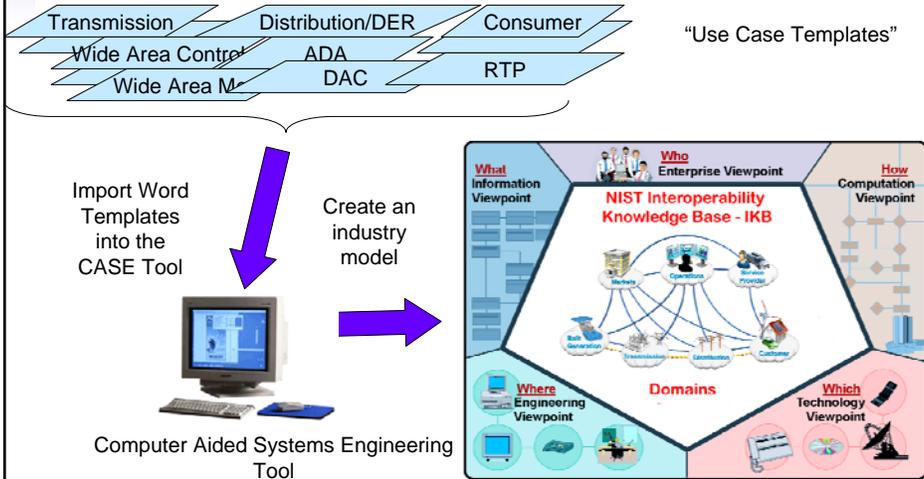

## Why Use a Model and Tools?

- Systems are Becoming More Complex
- Scale and Scope of Next Generation Equipment
  - Thousands to Millions of Pieces of Field Equipment
  - Diverse Physical Media
  - Equipment Supplied by Multiple Providers
  - More Sophisticated Control and Management
- Need to Manage and Document Systems:
  - Initial Requirements and Designs
  - Life Cycle Management
- Open Standards Drives Need for Well Managed Equipment Interfaces and Integration

## IntelliGrid Requirements Development: Use of a “Domain Template”

## Conversion from Requirements to A Model

## Requirements Template Example Use Case: Customer Communications

### Step 1. Develop a Narrative Description of the Application

- An expert describes in text form how a given future power engineering function is performed including the high level business and technical context.
- Narrative focuses on the necessary distributed computing needs/requirements of the function
- Includes diagrams that can be understood by the stakeholder communities..power engineers, rate administrators etc.

## Requirements Template Step 2. Identify the Actors

- From the narrative, determine the key players, or **Actors (devices, people, systems)**.
- Name the actor and describe what it does in tabular form

### 1.5 Actor (Stakeholder) Roles

Grouping (Community)		Group Description
Actors Functioning from Customer Premises		Actors that perform their specific functions from the premises of the Customer.
Actor Name	Actor Type (person, device, system etc.)	Actor Description
Customer Energy Management System	System	CEMS. Customer owned premise system which interfaces with the Home Area Network and the AMI Premise Interface to provide services for load management and distributed generation. Additionally, may provide the Customer ability to control Customer owned equipment independent of the AMI.
Customer	Person	Residential or small business energy user that has a contract with the utility to receive electrical service from the utility and have a meter installed (possibly an AMI Meter). The Customer may or may not participate in programs provided by the utility including pricing events, load control or distributed generation.
AMI Premise Interface	System	The AMI Premise Interface is one of the communications radios that could be "under glass" of the AMI Meter. (There are two radios built in to the AMI Meter. One is for the AMI System and is a longer range radio. The other is for the AMI Premise Interface and it has a smaller range.) This is the communication resource to the Inverter and the Home Area Network (if available).

### 3. Identify the Information Exchanged between Actors

- What information do the actors exchange?
- Focus on exchanges that may cause communications problems.

Information Object Name	Information Object Description
PNM Solar PV Incentive Program Application	Application available on the PNM Website for the Customer to complete when they are interested in enrolling in the Solar PV Incentive Program.
Approval of the PNM Solar PV Incentive Program Application	Approval of the Customer Application for the Customer to complete when they are interested in enrolling in the Solar PV Incentive Program.
Installation Phase	Installation phase of the Customer PV System.
Completed PV Installation	Completion of the installation of the Customer PV System.
Customer PV Installation Information	Equipment and Account Information for the Customer PV Installation

### Example Use Case: Meter Reading

#### 4. Define Steps

- What happens, and in what order? Steps are numbered.
- References the actors and the information
- Formal, rigorous, *machine-readable* description of the narrative

#	Event	Primary Actor	Users of Primary Actor	Description of Primary Actor	Information Produced	Information Received	Users of Info Received	Additional Info	UMLA Environment
1.1	Customer indicates the desire to begin the process with PNM to install a Customer owned PV System that will be tied into the PNM electric grid.	Customer	Submits PNM Solar PV Incentive Program Application	Customer completes the PNM Solar PV Incentive Program Application available from the PNM website and submits PNM Solar PV Incentive Program Application to the PV Program Manager.	Customer	PV Program Manager	PNM Solar PV Incentive Program Application		
1.1	PV Program Manager reviews the PNM Solar PV Incentive Program Application of the Customer	PV Program Manager	PV Program Manager reviews the PNM Solar PV Incentive Program Application of the Customer	PV Program Manager reviews the PNM Solar PV Incentive Program Application of the Customer and the potential DG percentage threshold for the feed-in question.	PV Program Manager	PV Program Manager	PNM Solar PV Incentive Program Application		

## Example Use Case: One Way AMR

### 5. Identify Architectural Issues

- For each step, mark multiple-choice X's regarding configuration, quality of service, security and data management
- A *machine-readable* rating of qualitative values.

Quality of Service Requirements		Advanced Auto-Restoration												
Quality of Service Requirements, as well as Constraints and Problems		Use Case Steps												
Please describe typical, probable, or envisioned communication configurations that are relevant to the Use Case Step. In some cases, only one of the possible choices is reasonable, while for other situations, more than one choice is reasonable. Feel free to add comments or even new choices		Pre-conditions	Report Fault	Report Loss of Service	Initial Trip	First Reclose Attempt	Report Fault	2nd Trip	Auto-recloser Power Restored	Report Upstream Power Restored	Request Isolation	Confirm Isolation	Isolate Fault	Report Isolation Complete
		Pre	1A	1B	2.1	2.2	2.3	2.4	2.5	2.6	3.1	3.2	3.3	3.4
<b>Typical, Probable, or Envisioned Quality of Service Requirements</b>														
a. Elapsed time response requirements for exchanging data:														
- 14 milliseconds														
- 4.0 milliseconds														
- Less than 1 second		X	X	X										
- 1.2 seconds														
- 10 seconds										X			X	X
- More than 10 seconds											X	X	X	X
- No specific response requirements														
b. Other <u>Must occur between trip and reclose</u>									X					
- Current actual timeliness for exchanging data is required:														
- Within 1 second														
- Within 1 minute														
- Within 5 minutes														
- Within some longer time														
- No specific contractual timeliness is required		X	X	X	X	X	X	X	X	X	X	X	X	X
- Other														
a. Availability of information files:														
- 99.9999% + availability - 102 seconds per year														
- 99.999% + availability - 15 minutes per year														
- 99.99% + availability - 1 hour per year														
- 99.9% + availability - 0 hours per year		X	X	X	X	X	X	X	X	X	X	X	X	X
- 99% + availability - 135 days per year														
- 98% + availability - 1 month per year														

Less than one second end-to-end, but not less than 10 ms

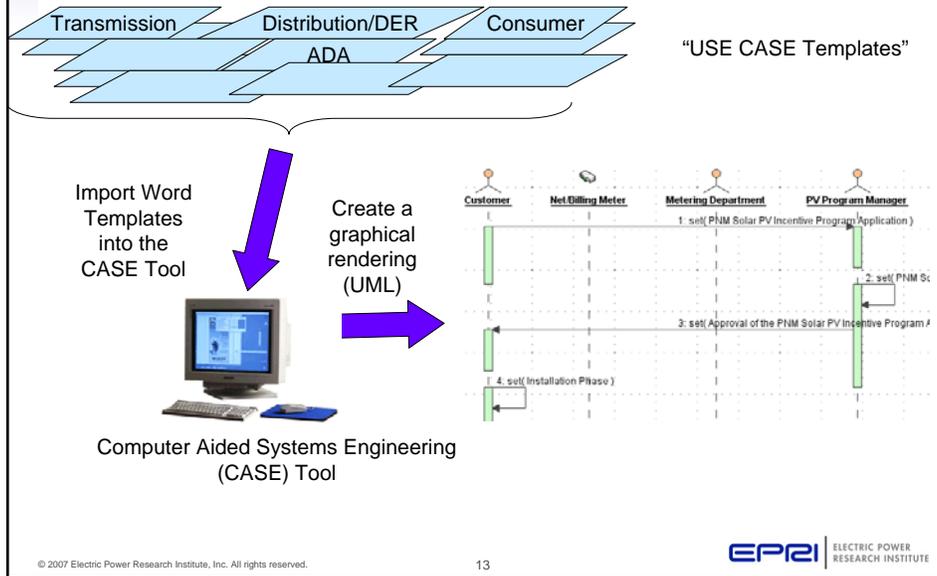

No contractual requirements

99.9% availability required

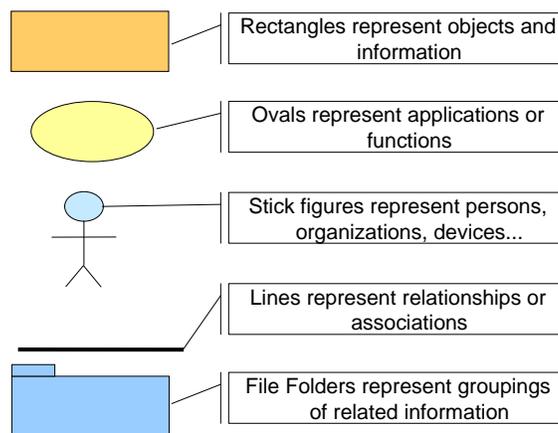

## Unified Modeling Language

- A Standardized Form of Graphically Representing System Processes
- Standardized by the Object Management Group
- Developed out of the Software Industry
- A way to represent applications to complement text

## Import Requirements into System Model

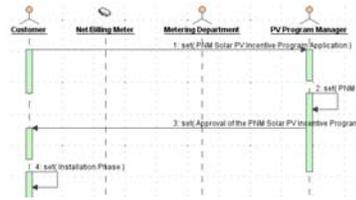

## Easy To Draw Diagramming: the Unified Modeling Language

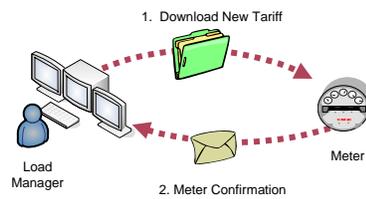

## Comparison of stick figure vs. graphic diagrams

Stick Figure version

Graphics version

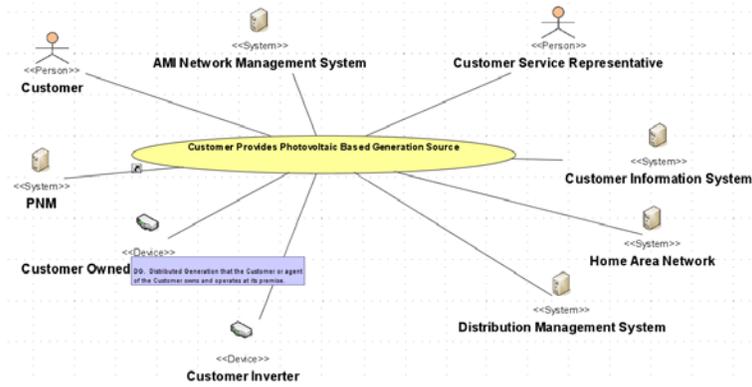

## Introduction to UML Diagrams

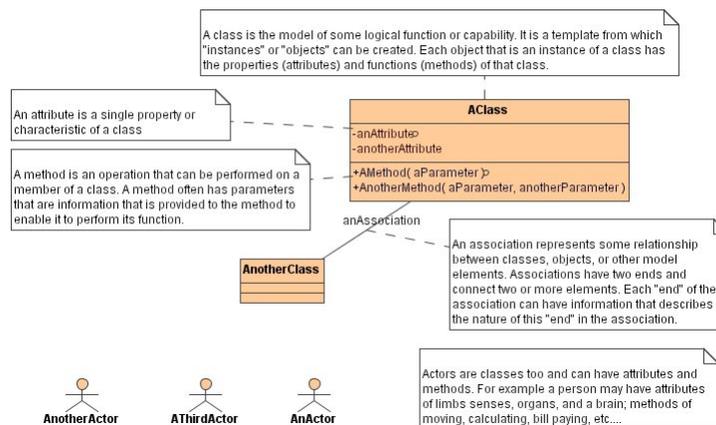

### Introduction to IntelliGrid Diagrams

<b>Who:</b>	 <b>aUseCaseDiagram</b>	A Use Case Diagram presents an example of an application or function. It is used to illustrate "who" is involved in the application(s).
<b>What:</b>	 <b>AClassDiagram</b>	A Class diagram shows the "what" of architecture.
<b>How:</b>	 <b>aSequenceDiagram</b>	A sequence diagram also illustrates the "how" an application is implemented. Sequence diagrams focus on the flow of messages relative to the passage of time.
<b>How:</b>	 <b>anActivityDiagram</b>	An activity diagram illustrates a business process. It is the "how" a function is logically implemented. It shows the step by step flow of activities between participants in the process, as well as, the pieces of information exchanged and what causes the transition from one step to the next.

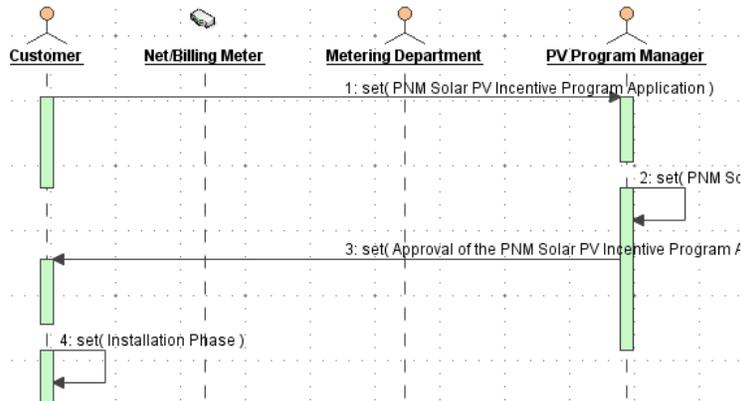

## Use Case Diagram : Who is involved... Customer Provides PV Based Generation Source Example

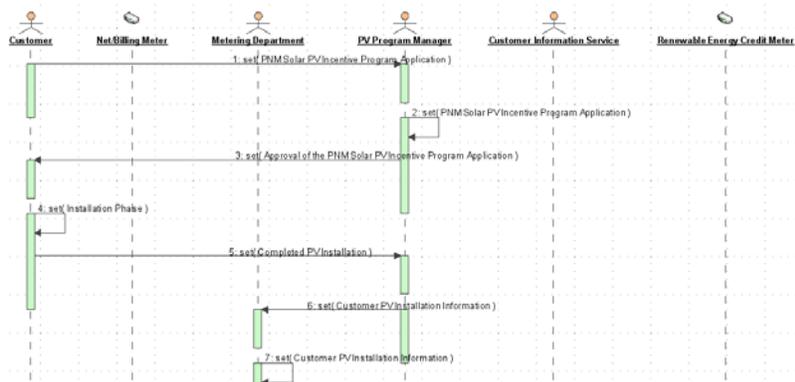

## A Class Diagram Shows the Composition of What a Class or Object Is

## A Sequence Diagram Shows How a Use Case Works

## Customer Provides PV Based Generation Source example - Steps Show How it is implemented

## Normalization Process Examples

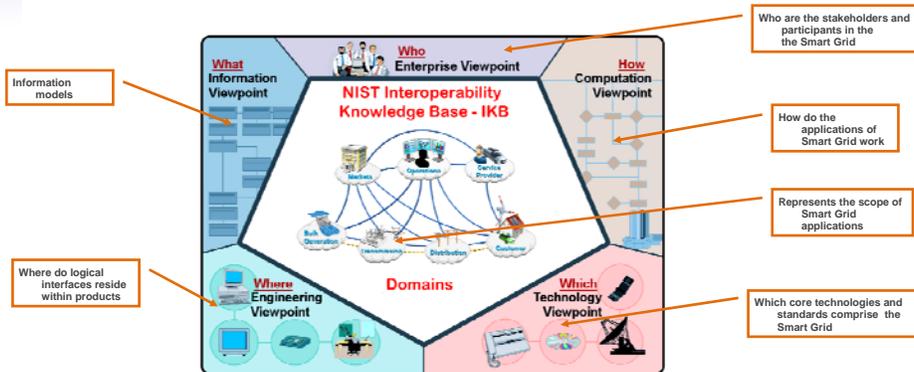

### Actors Before

- Electric Meter
- Line Meter Device
- Meter Device
- MeterDevice
- Meters
- MeterDataManagementAgent
- Meter Data Management Agents
- MDMA
- MDMA Metering

### Actors After

- Meter
- MeterDataManagementAgent (MDMA)

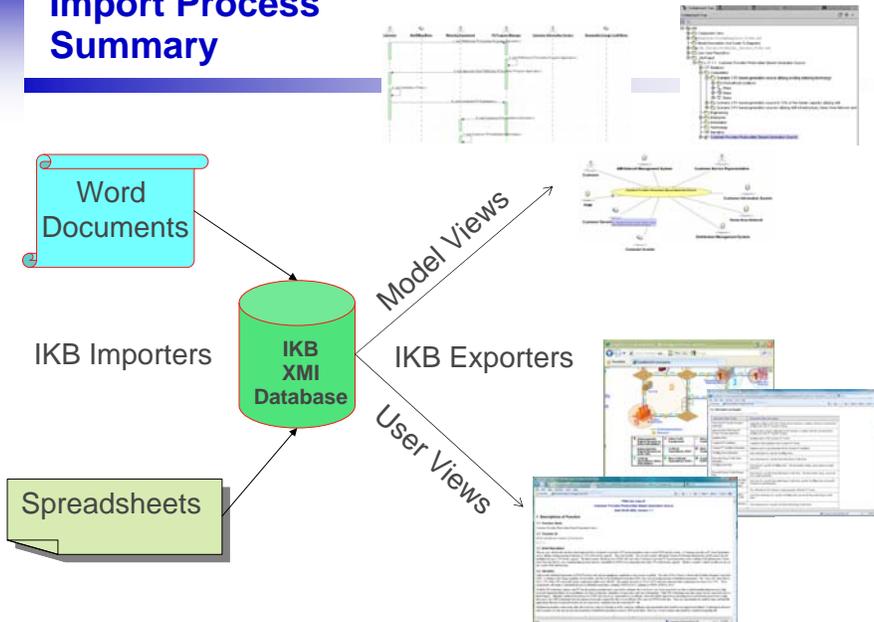

## Graphic of Smart Grid IKB Model

## Presentation Overview

- Background on Models and Tools For Advanced Systems
- • The Import Process for PNM Use Cases
- Background on NIST Knowledge Base Development

## Import Process Summary

## Presentation Overview

- Background on Models and Tools For Advanced Systems
- The Import Process for PNM Use Cases

- Background on NIST Knowledge Base Development

## Knowledge Base Definition

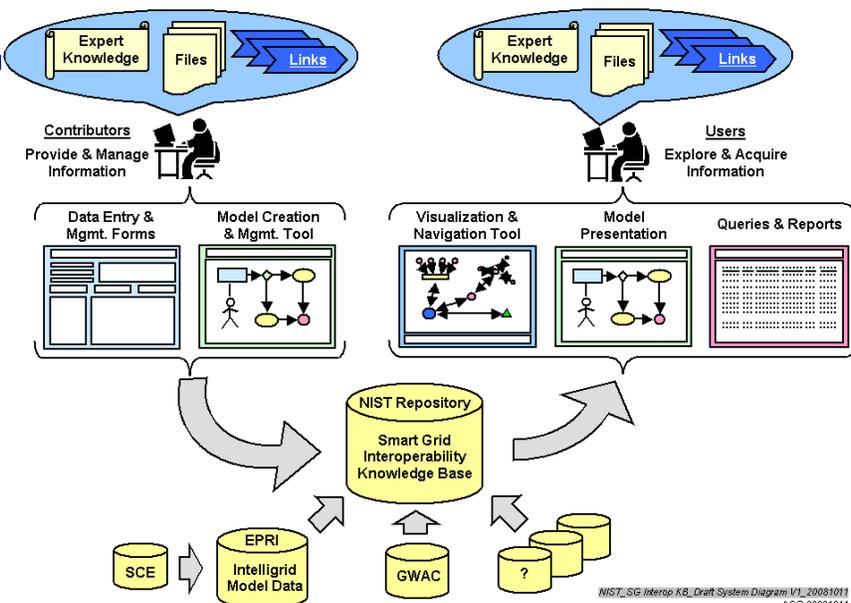

- A centralized repository of information, a database of knowledge about a particular topic.
- May be Machine Readable and/or Human Readable
- Not a Static collection of information but dynamic
- For the Smart Grid:
  - Information on Use Cases and Requirements
  - Status of Standards Development
  - Ontology/Glossary of Standardized Terms Traceable to Standards
  - A tool for graphical renderings of content

## Project Context and Background

- “NIST Plans to develop a publicly-accessible interoperability knowledge base that will be the repository of information necessary to do standards assessments\*”
- EPRI Project Goals:
  - Assist Technical Integration of EPRI’s Prior Work into the NIST Knowledge Base
  - Develop Methods to Import Use Case “template” Information into the Knowledge Base Model

\*Patrick Gallagher, Ph.D., Testimony Before the Committee on Energy and Natural Resources US Senate

### NIST Smart Grid Interoperability Knowledge Base >> Draft System Concept Diagram, Version 1.0

# Questions?

## Critical Integration Technologies and Standards

- Intelligrid-Based Use-Case Analysis
- Zigbee/Homeplug, BACNET – Customer Side
- IEC Standards – Utility Side
- CIM – Operations Integration
